Founder: Prof. Dr. S. B. Mujumdar, M. Sc., Ph. D. (Awarded Padma Bhushan and Padma Shri by President of India)

EXPERIMENT NO – 8

1. AIM - Access and validate form fields using events; design a gym admission form with live input checks.

2. SOFTWARE REQUIRED - Visual Studio Code, Web Browser (Google Chrome), HTML, CSS, JavaScript, Live Server extension

3. THEORY –

Form validation is used to check whether the information entered by a user is correct before the form is submitted. In this experiment, JavaScript event handling is used to perform live input validation.

The form uses fields such as Full Name, Email Address, Phone Number, Membership Plan, Password, and Confirm Password. JavaScript checks each field while the user enters information or submits the form.

The following validations are performed:

- Full name should not be empty.
- Email should be in a valid format.
- Phone number should contain exactly 10 digits.
- A membership plan must be selected.
- Password must contain at least 6 characters.
- Confirm password must match the original password.

Invalid fields display error messages and a red border. When the input becomes valid, the error indication is removed. After all validations are successful, a confirmation message is displayed.

4. OUTPUT –

Gym Admission Form

Full Name
Arya Khandekar

Email Address
aryakhandekar09@gmail.com

Phone Number
8900006543

Age
20

Membership Plan
Monthly Pack

Submit Admission

Designed by: Arya Khandekar
PRN: 24070521219

5. CONCLUSION –

Thus, the experiment was successfully completed. A Gym Admission Form was designed, and JavaScript events were used to access and validate form fields in real time. The experiment demonstrated how client-side validation improves user interaction, prevents incorrect data submission, and provides immediate feedback to the user.
